

User Acceptance Testing (UAT)

User Acceptance Testing (UAT) was conducted to verify that the **Network Request Management System** meets the business requirements and provides a smooth experience for end users. The testing was performed from the user's perspective to ensure that all major functionalities work as expected before the solution is considered ready for deployment.

UAT Objectives

- Verify that the Network Request form is user-friendly.
- Ensure all mandatory fields are validated correctly.
- Confirm successful submission of network requests.
- Validate that request information is stored accurately.
- Ensure users can access the required catalog item without issues.
- Verify that the application satisfies the defined business requirements.

User Acceptance Test Cases

Test Case	Expected Result	Status
Access Service Portal	Portal opens successfully	Passed
Open Network Request Catalog Item	Request form is displayed correctly	Passed
Enter Request Information	All required fields accept valid input	Passed
Submit Network Request	Request is created successfully	Passed
View Submitted Request	Request details are displayed correctly	Passed
Validate Mandatory Fields	System prompts users to complete required fields	Passed

UAT Observations

The application successfully met the expectations of end users during testing. Users were able to navigate the Service Portal, complete the request form, and submit network requests without encountering functional issues. The interface was intuitive, request data was captured correctly, and the overall process was easy to understand and follow.

User Feedback

- The request submission process is simple and easy to use.
- The catalog form is well organized and user-friendly.
- Mandatory field validation helps reduce incomplete requests.
- The system provides a structured and reliable way to manage network service requests.

UAT Conclusion

The **Network Request Management System** successfully passed User Acceptance Testing and met the functional requirements defined for the project. The solution is ready for deployment and can effectively support users in submitting and managing network service requests through the ServiceNow platform.
