

Problem Statement

Current Challenges

Many organizations continue to manage network-related service requests through emails, phone calls, spreadsheets, or manual communication. This traditional approach creates several operational challenges that affect both employees and IT support teams.

The absence of a centralized request management system often results in delayed request processing, incomplete information, poor visibility, and inconsistent service delivery. As the number of requests increases, it becomes difficult to prioritize, monitor, and resolve them efficiently.

Problems Identified

- Network requests are submitted through multiple communication channels.
- Request information is often incomplete or inconsistent.
- Manual handling increases response and resolution time.
- Employees cannot easily track the progress of their requests.
- IT administrators spend additional time collecting missing details.
- Lack of a standardized workflow causes delays and confusion.
- No centralized system exists to manage all network service requests.

Need for the Project

To overcome these challenges, a centralized **Network Request Management** system is required. The solution should provide a structured request form, capture complete user information, automate request handling, and improve communication between employees and the Network Support Team.

The system should also ensure transparency, reduce manual effort, and provide a better us
