

Solution Requirements

The **Network Request Management System** is designed to provide a centralized, efficient, and user-friendly platform for managing network-related service requests. The solution leverages the ServiceNow platform to automate request submission, organize request information, and improve communication between employees and the Network Support Team.

To ensure the successful implementation of the solution, the following functional and non-functional requirements have been identified.

Functional Requirements

- Users should be able to submit network service requests through the ServiceNow Service Portal.
- The system should capture requester details such as **Name, Email ID, and Phone Number**.
- Users should be able to select the request type (New Connection or Relocation).
- The system should collect device details and installation address.
- All submitted requests should be stored securely in the ServiceNow database.
- The system should support automated request processing through Flow Designer.
- Users should receive notifications regarding their request status.
- Network administrators should be able to view, manage, and update all requests.

Non-Functional Requirements

- The system should provide a simple and intuitive user interface.
- Request submission should be completed with minimal response time.
- User information and request data should be securely stored.
- The application should be available to authorized users whenever required.
- The solution should be scalable to support future enhancements and additional services.

- The system should maintain data accuracy and consistency throughout the request lifecycle.

Expected Solution Benefits

- Centralized management of all network service requests.
- Reduced manual effort and paperwork.
- Faster request processing and resolution.
- Improved request tracking and transparency.
- Better communication between employees and the Network Support Team.
- Increased operational efficiency and service quality.
